

# Client Variables and Site Properties

What is a Client Variable?

When to use Client Variables

What is a Site Property?

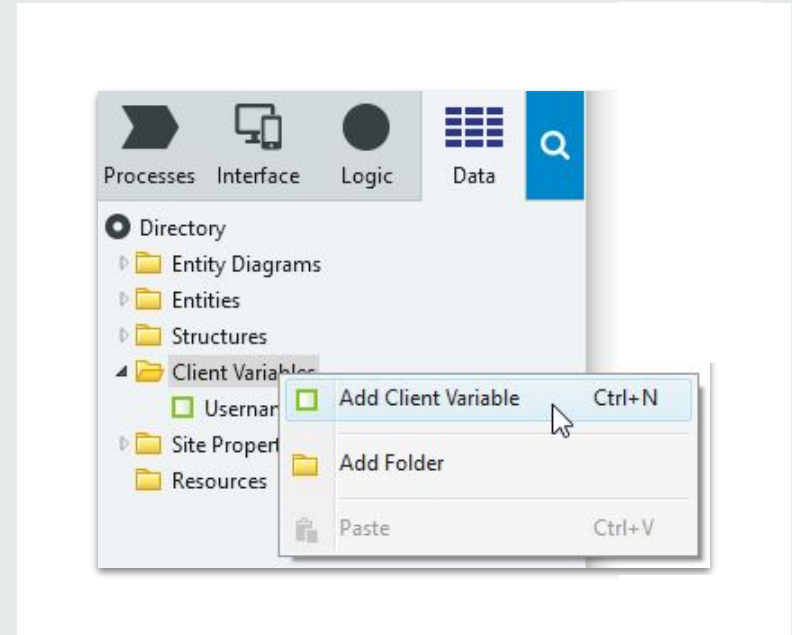

When to use Site Properties

# What is a Client Variable?

A Client Variable is a **configuration variable** that allows to store **long-lived** and **user-specific** information

# Client Variables

- Restricted to Basic Data Types and Entity Identifiers
- Values are stored in the browser
  - Kept on Login
  - Reset to default on Logout
- Avoid storing sensitive or confidential information

# When to use Client Variables

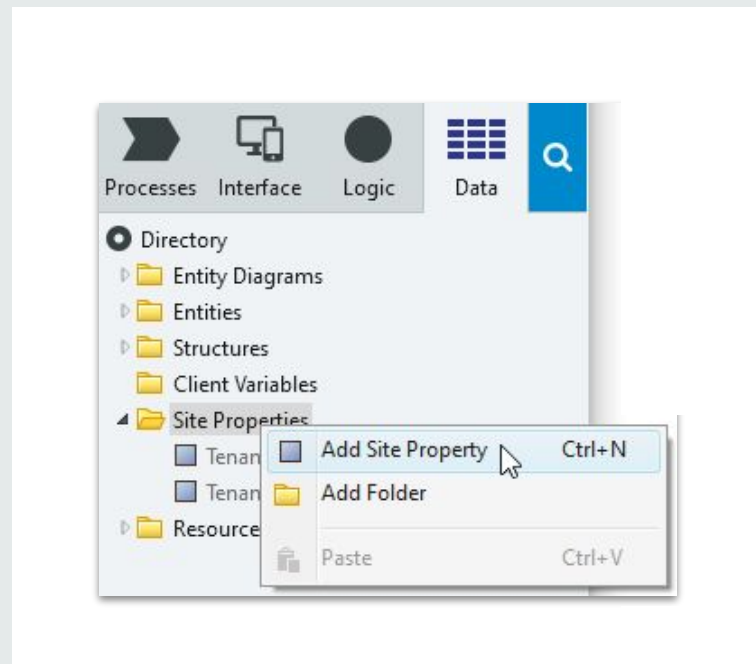

- Cache frequently accessed values
  - Username
- User configurations/settings
  - Search Keyword
  - Items per page
  - Selected Layout (e.g. grid vs. table)

# What is a Site Property?

A Site Property is a server-side **configuration variable** that allows to store **application-wide** information

# Site Properties

- Restricted to Basic Data Types and Entity Identifiers
- Values can be changed at runtime (via Service Center)
  - No development required
  - Avoid recurrent changes
- Environment-specific
  - Different values for Development and Production

# When to use Site Properties?

- When values are not supposed to change often
- Application configurations
  - Email Address
  - API Keys
  - Enable/Disable app features
